

CERTIFICATE

OF INTERNSHIP

This is to certify that

Siddharth Tarunbhai Sadhu

has successfully completed an online summer internship program offered by the Vicharanashala -
Lab for Education Design, IIT Ropar, from May 25, 2026 to August 18, 2026.

PROGRAM SCORECARD

During this period, Siddharth engaged across four verticals: synchronous learning sessions, asynchronous coursework on an AI-based learning platform, Foundations of Data Science as a peer endorsement activity, and a mentor-reviewed final open-source project, and met all requirements for successful completion.

Verticals	Progress
Synchronous Learning Sessions	Attendance 5067 min (target: 3600)
	Poll participation 85%
Asynchronous coursework (AI & MERN)	100%
Peer Endorsement (Foundations of Data Science)	Endorsements received 50
	Endorsements given 0
	SPA score* +5155.08
Final Project (Open-Source)	PR: https://github.com/vicharanashala/pybe/pull/69

*See Glossary (last page).

PROGRAM OVERVIEW

ABOUT THE VINS INTERNSHIP

The VINS Online Summer Internship is hosted by the Vicharanashala Lab for Education Design at IIT Ropar, in partnership with the AI Centre for Excellence in Agriculture, ANNAM.AI. It runs as a working internship rather than a course, and interns produce real, reviewed output across four verticals, each independently gated for completion.

Each of the four verticals has to be cleared on its own; completion is never an average across them. Pages 4 through 7 explain what each one involved, followed by a closing engagement reflection and, where available, a mentor testimonial. A glossary of terms closes out this document.

Synchronous Learning Sessions

Live cohort discussion & mentor guidance

Asynchronous Coursework

Self-paced Fundamentals of AI & MERN on ViBe

Peer Endorsement

Foundations of Data Science

Final Project

Mentor-reviewed open-source work

VERTICAL 1 OF 4

SYNCHRONOUS LEARNING SESSIONS

Interns attended scheduled live cohort sessions daily throughout the internship period: 9:00 to 11:00 AM IST earlier in the program, moving to 8:00–9:00 PM IST later on. These sessions went well beyond technical progress check-ins and doubt-clearing: they built soft skills such as communication, encouraged philosophical and critical thinking, and connected computer science concepts to real-world examples, theories, algorithms, and patterns observed in everyday life. Separate mentor guidance sessions, held at different times, were available but non-mandatory. Active participation was additionally captured through live polls on **Spandan**, our in-house live polling platform.

BRADFORD SCORE 0 (0 spells • 0 days missed)

Cohort median: 1 — lower is better; 0 means no missed sessions

Siddharth consistently attended and actively participated in daily synchronous sessions, exceeding the target engagement time with a total of 5067 minutes recorded across the program. Their commitment is further evidenced by an impressive poll participation rate of 85%.

VERTICAL 2 OF 4

ASYNCHRONOUS COURSEWORK

Fundamentals of AI & MERN (via ViBe)

Outside live sessions, interns worked through structured, self-paced coursework on **ViBe**, our in-house AI-powered learning platform, completing two tracks one after the other: Fundamentals of AI using an agricultural dataset (including a capstone project requirement), followed by MERN-stack web development. Both tracks require 100% completion.

Siddharth demonstrated exceptional commitment to their coursework, achieving a perfect completion rate of 100% in both the AI and MERN components of the ViBe program. Their dedication is reflected in the thorough and timely submission of all coursework requirements.

VERTICAL 3 OF 4

PEER ENDORSEMENT

Foundations of Data Science

This track worked differently from the other three: instead of a mentor or an automated checker, interns completed a structured peer endorsement activity, working through a set of foundational data-science questions and having their understanding confirmed by fellow interns. A defined subset of the question set is mandatory, and completion requires an endorsement on every mandatory question.

Siddharth received the required peer endorsement on all 50 mandatory questions, showcasing their strong grasp of the Foundations of Data Science material. They approved 0 peer endorsements, indicating opportunities for further engagement in supporting their peers.

VERTICAL 4 OF 4

FINAL PROJECT

Open-Source Contribution

The internship closes with a capstone project: a real, mentor-reviewed contribution to an open-source codebase, submitted as a branch or pull request against a codebase other people actually use. It is where the AI and MERN skills and the analytical grounding from the peer endorsement track come together, submitted for review against a genuine engineering bar.

Siddharth made significant contributions to the PyBe platform as the lead technical owner of the core engine stack. They personally architected, built, and delivered the complete Scenario-Based Case Study Pipeline & Execution Engine, including the 7-Step Case Study Generator and 4-Pass Streaming Pipeline. Their work also included integrating the Canonical Story Grounding Engine and implementing Multi-Key Rate-Limit Cooldown features, demonstrating their technical expertise and leadership. This work is documented in a detailed pull request on GitHub.

SPURTI — ENGAGEMENT REFLECTION

The following reflects Siddharth's engagement across the internship beyond the four graded verticals. It is generated from their recorded activity and reviewed before inclusion here.

LEVEL AWARDED (SPURTI) 17/25 • Legend

Siddharth demonstrated exceptional commitment throughout the program, maintaining near-perfect attendance and consistently engaging with in-session polls. Their strong participation in the live sessions underscored their dedication to the learning process, and they approached each session with a proactive mindset that reflected their enthusiasm for the material. Their focus on mastering the content was evident in their engagement with the Foundations of Data Science peer-endorsement track, where they successfully completed and received endorsements on all 50 mandatory questions.

In the final project, Siddharth took on a significant leadership role as the lead technical owner of the PyBe core engine stack. They demonstrated their technical prowess by architecting, building, and delivering the complete PyBe Scenario-Based Case Study Pipeline & Execution Engine, specifically the cklisOrchestrator.ts component. Their contributions resulted in one submitted pull request to the PyBe platform, showcasing their ability to deliver high-quality work under real-world constraints. Siddharth's project contributions clearly reflect their capability to drive impactful technical solutions.

This reflection is generated from Siddharth's recorded engagement data (attendance, polls, peer-learning activity, and project contributions) and has been reviewed for accuracy before inclusion. It does not represent a numeric Spurti score or a ranking against other interns.

REFERENCE

GLOSSARY

Plain-language definitions of the terms used across this scorecard, for anyone reading it who hasn't been part of the program.

Bradford Score

Not just how many sessions someone missed, but how disruptive the pattern was. Missing one day here and one there, spread across weeks, counts against a student more than missing the same number of days all in one stretch — scattered absences are harder on a cohort's continuity than a single block of time away. (For the curious: it's $\text{spells}^2 \times \text{days}$ missed, where a "spell" is one separate stretch of absence.) Lower is always better, and 0 means the student never missed a mandatory session.

Synchronous

Happening live, at a scheduled time, with everyone present together (the daily cohort sessions).

Asynchronous

Self-paced, done independently on the intern's own schedule rather than at a fixed time (the ViBe coursework).

ViBe

The self-paced online learning platform interns use for the Fundamentals of AI and MERN-stack coursework.

MERN

The web technology stack covered in the coursework: MongoDB, Express, React, and Node.js.

Peer Endorsement

A track where interns confirm each other's understanding of foundational concepts directly, rather than being graded only by a mentor or an automated system.

SPA Score

Points earned through participation in the peer endorsement track — by endorsing peers and by receiving endorsements on one's own answers.

Spandan

Our in-house live polling platform, used during synchronous sessions to check engagement in real time.

Spurti

The system that tracks and recognises engagement and consistency across the internship, beyond the four graded verticals.

Pull Request (PR)

A formal proposal to add a piece of code to a shared project, reviewed by someone else before it's accepted. Each pull request listed here reflects real, submitted work that has gone through mentor review — merging is a separate, later step that may still be in progress.
